Test automation task:

Volvocars has saved more than a million lives with its three-point seat belt and we are on a mission now to save a million more lives, starting with this [campaign](#). You are the test lead for the campaign team and you need to setup a set of automated test suite using [webdriverio](#).

Things we would like to see in the code:

1. Setup the solution with its Dockerized image

2. Parallel execution of tests

3. Reporting of the results

4. Documentation

Bonus Points:

Use Kubernetes solution [(parallel distributed testing)](#)

Visual regression testing ([wdio-image-comparision)](#)

Note: Please only test this page https://www.volvocars.com/intl/v/car-safety/a-million-more, do not try subscribing or buying a car, unless Ofcourse you want to really get a Volvocars for yourself.
